PROFILE

With backgrounds in education and finance, I am an ambitious full-stack web developer who develops from a responsive and accessibility-first approach in order to best build creative applications defined by streamlined user experiences. I have built applications both solo and among other developers in an agile workspace, the most recent of which I was lead engineer and concept creator.

MY PROJECTS

ROMANTIC DATE PLANNER | Javascript HTML CSS BootStrap Tailwind
https://doshpocket.github.io/romantic-date-planner/

As lead engineer and concept creator in an agile workspace, with the support of three other developers, we built a web application that assists a busy avid dater in planning their upcoming dates. The app randomly chooses a date activity and offers the user a keyword search tied to an API relevant to the activity. The search results can be saved into local storage and onto a list of upcoming dates on the main page for convenience.

PROFESSIONAL README GENERATOR | Node.js Inquirer
https://github.com/DoshPocket/professional-readme-generator

A professional README generator to assist any developer in creating a README markdown document which meets the standards of the professional project it appears alongside. This generator uses Node.js prompts to gather the user data and write it in an organized fashion to a new README markdown file. It includes information such as project details, license preference, and contact information.

WEATHER DASHBOARD | Javascript HTML CSS BootStrap Font Awesome
https://doshpocket.github.io/weather-dashboard/

This functional weather dashboard links the application to an API and allows the user to search for weather conditions in any city, globally, while maintaining a search history that can be cleared with a button by the user. It presents temperature, wind speed, humidity, and UV index for the city searched and, in addition, displays a 5-day forecast featuring images.

CODING QUIZ | Javascript HTML CSS
https://doshpocket.github.io/coding-quiz/

Sole developer of this full coding quiz of five questions that, based on user answers, will award or deduct time, in real time, from a countdown timer, which affects the user's final score. User may input initials in order to save initials and score to local storage.
